DETAILED ACTION

Allowable Subject Matter

Claims 1-3 are allowed.

The following is an examiner's statement of reasons for allowance:

Claim 1 recites "a dust-removing ring disposed around an outer surface of the filter and moving along an axial direction; a manipulation unit disposed under the filter to approach to, and retreat from the filter; a connection member interposed between the manipulation unit and the dust-removing ring, for moving the dust-removing ring in association with the approaching and retreating movements of the manipulation unit; an elastic spring interposed between the filter and the manipulation unit, for urging the manipulation unit to retreat from the filter; and an operating bar upwardly protruding from a bottom of the dust collecting receptacle, for pressing the manipulation unit towards the filter". Oh(6811584) teaches a dust removing ring(410) disposed around an outer surface of a grill for a cyclone vacuum cleaner, wherein the dust removing ring moves along an axial direction. However, Oh fails to teach a filter connected to a discharge port and disposed inside a dust collecting receptacle, a manipulation unit disposed under the filter to approach to, and retreat from the filter; a connection member interposed between the manipulation unit and the dust-removing ring, for moving the dust-removing ring in association with the approaching and retreating movements of the manipulation unit; an elastic spring interposed between the filter and the manipulation unit, for urging the manipulation unit to retreat from the filter; and an operating bar upwardly protruding from a bottom of the dust collecting receptacle, for

pressing the manipulation unit towards the filter. It would not have been obvious to provide a manipulation unit disposed under the filter to approach to, and retreat from the filter; a connection member interposed between the manipulation unit and the dust-removing ring, for moving the dust-removing ring in association with the approaching and retreating movements of the manipulation unit; an elastic spring interposed between the filter and the manipulation unit, for urging the manipulation unit to retreat from the filter; and an operating bar upwardly protruding from a bottom of the dust collecting receptacle, for pressing the manipulation unit towards the filter because Oh does not suggest such a modification. Claims 2 and 3 depend on claim 1 and hence are also allowed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
